Foreword

The 2009 Kenya Population and Housing Census (KPHC) was conducted from the night of 24th/25th to 31st August 2009. The Census was the fifth to be undertaken in Kenya since independence and the seventh in the country's history. Previous censuses were conducted in 1948, 1962, 1969, 1979, 1989 and 1999. Planning and execution of the 2009 Census was spearheaded by the Kenya National Bureau of Statistics (KNBS) on behalf of the Government – in accordance with the Statistics Act, 2006. The theme of the Census was “*Counting our People for Implementation of Vision 2030*”, which was deemed necessary in order to respond to the greater demand for statistical information, for monitoring the implementation of Kenya's development plans and other global initiatives, such as the Millennium Development Goals (MDGs).

The main objective of the 2009 Census was to provide the Government and other stakeholders with essential information on the population, as regards demographic, social and economic characteristics, housing conditions and household amenities. By generating information at all administrative levels, it was also intended to provide a sound basis to evaluate the impact of population-related policies and programmes in the country.

The first series of the 2009 Census preliminary results were released on August, 2010, in a set of four volumes. The volumes presented census information in the following categories; Population Distribution by Administrative Units; Population Distribution by Political Units; Population Distribution by Age and Sex; and, Distribution of Households by Socio-economic Characteristics. This second set comprising thirteen analytical reports, addresses issues on Fertility and Nuptiality, Mortality, Housing Conditions, Amenities and Household Assets, Education and Training, Household and Family Dynamics, Disability, Migration, Urbanization, Labour Force Dynamics, Gender Dimensions, Population Dynamics, Population Projections and Census Atlas.

Preparation of the analytical reports involved collaborative efforts of both local and international experts as well as various Government Ministries and Departments. The authors were recruited on competitive basis, ensuring they possessed the necessary experience and skills. The authorship was done under the supervision of two experienced lead consultants.

Data capture was done using scanning technology. The processes were highly integrated, with tight controls to guarantee accuracy of results. To achieve internal consistency and minimize errors, rigorous data editing, cleaning and validation were carried out to facilitate further analysis of the results. The information presented in these reports is therefore based on more cleaned data sets, and is preferred in case there are differences in the results published in the first set of volumes.

This monograph presents information on population projections based on the 2009 census data for a twenty year period from 2010 to 2030. The projected population is expected to increase from 38.5 million in 2010, then to 44.2 million by 2015, 50.3 million by 2020, 57.0 million by 2025, and eventually reach 63.9 million by 2030.

On behalf of the Government of Kenya, I wish to thank the management and staff of Kenya National Bureau of Statistics, KNBS Board of Directors and authors for their contribution towards preparation of this monograph. I also thank the US Census Bureau for the technical support. I would also like to thank our development partners, especially UNFPA, for the financial support in writing and publication of this monograph.

Hon. Wycliffe Ambetsa Oparanya, E.G.H, MP
Minister of State for Planning, National Development and Vision 2030

Acknowledgement

The 2009 Kenya Population and Housing Census (KPHC), whose theme was “*Counting our People for Implementation of Vision 2030*” was the fifth to be conducted in Kenya since independence, and the seventh in the country’s history. The census was carried out on a *de facto* basis, with August 24th/25th as the reference night. The first series of the 2009 Census preliminary results were released in a set of four volumes, in August, 2010. This was achieved in a record time of one year after successful enumeration. This monograph is one among a set of thirteen, which are a culmination of an ambitious, synchronized and all-inclusive in-depth analysis process, addressing various topical areas regarding the demographic, social and economic profiles of the Kenyan population.

The 2009 Census was accomplished through concerted effort of various organizations, institutions, Government Ministries and individuals who assisted in a variety of ways to prepare, collect, compile, process, analyze and publish the results. Kenya National Bureau of Statistics (KNBS), on behalf of the Government, takes this opportunity to thank all those who participated in the preparation of this monograph.

Special appreciation goes to Dr. Edward Sambili, the Permanent Secretary in the Ministry of State for Planning, National Development and Vision 2030; the KNBS Board of Directors led by the Chairman, Mr. Edwin Shisia Osundwa, staff of Population and Social Statistics Directorate and the entire KNBS staff, for their spirited efforts towards successful compilation of the monographs.

We also thank our Development Partners, namely, UNFPA, USAID, UNICEF, DfID, UNDP, SIDA, and the US Census Bureau for their material, financial and technical support, offered during various phases of implementation. Additional gratitude goes to UNFPA for coordinating donor support to the Census process.

Finally, we sincerely hope that the data contained in this monograph will be fully utilized in the national development planning process by all stakeholders for, the welfare of the people of Kenya.

**A.K.M Kilele, MBS
DIRECTOR GENERAL
KENYA NATIONAL BUREAU OF STATISTICS**

Kenya's Population Growth, 1948~2030

Executive Summary

The projected size, composition and distribution of the population at different geographic units and points in time form a rational basis not only to gauge the primary needs of the Kenyan population, but also plan for these needs accordingly. This volume presents various components of population projections based on the 2009 Kenya Population and Housing Census in four chapters.

Chapter 1 presents the general introduction providing the background to census taking in Kenya, objectives of the 2009 census, general methodology employed in projecting the population, assessment of the data quality, and base population.

The cohort component method was used to project both the national and provincial populations while the ratio method of population projection was used at the county and constituency levels where the necessary input information about the components of population change were not readily available.

Although there were no irregularities in sex ratios at national level, there were serious irregularities in reporting sex at all ages in North Eastern province with a maximum sex ratio of 202 for those aged 60-64.

As recorded in past censuses, terminal digits (0 and 5) were highly preferred with zero having the highest preference, more so by females. It was evident that most respondents avoided reporting age ending with digit 1 followed by digit 9 and thus shifted their ages to end with the most likely terminal adjacent digit zero.

The Accuracy Index for the 2009 census was 23.7, which is fairly accurate, as it is on the lower scale of 20-40. Comparatively, the 2009 census had the best Accuracy Index followed by the 1989 census, with the 1979 census recording the worst at 28.1. Once again, data from North Eastern province reflected highly inaccurate reporting with an index of 108 (with 20 as the cut off point) followed by Nairobi province (64) in this category. Only Western province – with an index of 18 – fell in the category of accurate reporting. The rest of the provinces had indices that placed them in the category of inaccurate.

Chapter 2 documents the assumptions used in the three components of population change, i.e. fertility, mortality and migration. At both national and provincial levels, it was assumed that the decrease in TFR would continue till the end of the projection period. For example, the TFR was assumed to decline from 4.7 in 2010 to 4.1 in 2030. Similar fertility assumptions were made for each province using national and provincial estimates of TFR from the 2009 Census as inputs.

Mortality projections were based on projecting future expectation of life at birth. Expectation of life at birth was assumed to increase from 58.5 for males and 61.6 for females in 2010 to 65.3 and 69.5 in 2030 respectively. This was based on the fact that both the 2008/09 KDHS and the 2009 Census had shown improvement in infant and child mortality.

The AIDS-only age-specific mortality rates from the National AIDS Control Council data were used as the input in projecting the effect of AIDS. The result was a continued decline in AIDS-only mortality in future years. For example, by 2030, these computations indicate that there will be minimal impact of HIV and AIDS on the Kenyan population.

Like in previous censuses, Kenya continues to record very low volumes of international migration (less than 1%) – hence an insignificant factor in population change, and therefore not incorporated into the national population projections. At sub-national level, the average of the net migration figures in the last three censuses (1989, 1999 and 2009) were used to represent internal migration at the provincial level. It was assumed that these averages would remain constant for the entire projection period.

Chapter 3 outlines the results of the population projections at different levels. At national level, population is expected to increase from 38.5 million in 2010, then to 44.2 million by 2015, 50.3 million by 2020, 57.0 million by 2025, and eventually reach 63.9 million by 2030.

At provincial level, the population is projected to continuously grow throughout the projection period in all provinces. Provincial rankings by population size are not expected to change - Rift Valley is expected to remain the largest province and North Eastern the smallest. However, Nairobi is expected to experience the highest rate (4.7%) in its population increase – from 3.1 million in 2010 to 8.1 million in 2030. During the same period, Eastern and Western provinces are expected to experience the lowest rates (0.9% and 1.7% respectively) in their population increase.

Ranked by their projected population sizes, Nairobi county is expected to continue to be the most populous throughout the projection period. However, none of the next nine most populous counties are expected to maintain their ranks in the 20-year projection period. Among the counties whose ranks are expected to improve include: Nakuru (from 5 to 2); Kiambu (from 4 to 3); Mombasa (from 14 to 7); and Uasin Gishu (from 16 to 9). On the other hand, ranks of some of them are expected to decline: Kakamega (from 2 to 4); Bungoma (from 3 to 5); Meru (from 6 to 10); Machakos (from 9 to 21); and Kitui (from 10 to 24).

Nationally, pre-school age population is expected to increase from 3.5 million in 2010 to 5.5 million in 2030; those of primary school age from 8.2 million in 2010 to 13.0 million in 2030; while those of secondary school age from 3.5 million in 2010 to 5.7 million by 2030.

At regional level, the rate of increase in the projected school-age population within the projection period is expected to vary: Nairobi province is expected to take lead with its pre-school age population increasing at about five percent and both the primary school age and secondary school age populations increasing by about six percent; the three components of school-age populations in Coast and Rift Valley provinces are expected to increase by about three percent; Eastern province is expected to experience the least rate of increase in the three components – at between 0.2 and 0.5 percent.

The pool of potential workers at national level is expected to increase from 20.9 million in 2010 to 37.8 million in 2030. Regional variations in the projected labour indicate that Rift Valley province is expected to contribute about 30 percent of the national total followed by Nairobi and Nyanza provinces at 14 and 13 percent respectively. North Eastern province is expected to continue its minimal contribution at 3.0 percent.

If constituency boundaries were to remain unchanged, Embakasi and Kasarani are expected to be the top two most populous constituencies, while Lamu East is expected to continue as the least populous constituency in the country followed by Isiolo South constituency.

Results of household projections indicate that by 2015, there will be approximately 12.0 million households and about 14.0 million households by 2020. Nairobi, which is entirely urban, will require nearly 2 million houses to host its population by 2020.

Chapter 4 summarises the projection results and offers the following recommendations:

1. All critical aspects concerning data quality be addressed at different stages of census management: design of questionnaire (maintain the bare minimal of questions); publicity (pointing out various data quality issues, especially those associated to specific regions); training (as a useful forum to improve data quality); field coordination (for quality assurance);
2. The questionnaire should clearly capture issues on rural-urban migration and also Kenyans in the diaspora;
3. Counties be advised to invest in improving systems that will serve as sources of relevant data to their needs. These will include baseline surveys, vital registration systems, etc;
4. Given that the school-age population is expected to increase at an average annual rate of slightly above 2.0 percent, it is imperative upon the relevant ministries to plan accordingly such that the supply side is not overwhelmed by the demand. This kind of planning will positively contribute to the attainment not only of the national goals on education, but also in achieving the MDG 2;
5. The projected labour force is expected to continue increasing at an average annual rate of about 3.0 percent. It is, therefore critical that relevant ministries explore modalities for increased job creation both in the formal and informal sectors; and
6. Regular reviews of the projections be undertaken whenever new pieces of data become available.

Chapter 1-Introduction

1.1 Census Background

A population census is the total process of collecting, compiling, evaluating, analyzing and publishing or otherwise disseminating demographic, economic, and social data pertaining, at a specified time, to all persons in a country or in a well delimited part of a country. It is vital for effective national development planning because it provides detailed bench-mark data on all population characteristics. The United Nations recommends that national population censuses should be undertaken at regular intervals of ten years.

The 2009 Kenya Population and Housing Census was the fifth to be undertaken in Kenya since independence and the seventh since 1948. Like the previous censuses, the 2009 Census was a *de facto* census conducted on the night of 24th/25th August 2009, though questionnaire also allowed *de jure* enumeration. The 2009 Census was implemented in accordance with the Statistics Act 2006. The theme of the census was “*Counting our people for the implementation of Vision 2030*”.

Objectives of the 2009 Census

The main objective of the 2009 Census was to provide essential information at the national and sub-national levels on the demographic, social and economic characteristics of the population, as well as housing conditions and household amenities to assist the Government of Kenya in the implementation, monitoring and evaluation of Kenya Vision 2030. The specific objectives were to ascertain the following:

1. Size, composition and spatial distribution of the population.
2. Levels of fertility, mortality and migration rates.
3. Rates and patterns of urbanisation.
4. Levels of education attained by the population.
5. Size and deployment of the labour force.
6. Size, types and distribution of persons with disabilities.
7. Housing conditions and availability of household amenities.

New modules included in the 2009 Census were: disability; information, communication and technology (ICT); deaths in the household; number of livestock owned; and information on emigrants.

1.2 Relevance of population projections

The primary needs of the Kenyan people, which development programmes aim to satisfy, cannot be gauged rationally without regard to the expected size, composition and distribution of the population at different geographic units and points in time.

There are four distinct areas in which population projections are a necessary input:

1. **Distribution of resources** - planning is the most obvious and frequent use of population projections. National, regional and local planners all need, for various

purposes, to have some idea of likely future changes in size, composition and distribution of the population in their respective areas. The new structure of devolved governance in Kenya introduces a greater demand for projected population figures at sub-national level like never before.

2. They are used for **advocacy** – especially where there is a negative impact of a particular phenomenon on population or vice versa;
3. **Research** - researchers frequently use projections for research purposes in order to try to answer questions such as *what would happen if?* However, population change can equally be regarded as being, to some extent, a dependent rather than independent variable in the planning process. As such, population projections can also be used to estimate the likely demographic impact of planning decisions and policy changes, as well as planning and policy implications of demographic change; and
4. **Monitoring and evaluation** - population projections become an important input for programmes not only during target setting, but also for monitoring and evaluation, especially at impact level. They are useful in assessing whether Kenya is on track in achieving national and international development targets such as the Millennium Development Goals to which it has committed itself to achieving. Most of programme indicators in monitoring progress need population figures as denominators.

1.3 Methodology

Data Collection Procedures

The 2009 Census, like the previous censuses, adopted the *de facto* as opposed to *de jure* approach, and the canvasser as opposed to the householder method. However, an additional question was included to identify whether each individual was a usual resident in the household of enumeration, which helped to compile the *de jure* population. Additionally, some foreign and diplomatic missions were allowed to enumerate themselves using a short questionnaire.

The target population was all persons who spent the night of 24th/25th August, 2009 in households, institutions, or outdoor locations within the administrative boundaries of Kenya or those transiting through Kenyan territory on census night. The frameworks of identification were defined to cover populations in conventional households, institutions, on transit and even those with no fixed abode (out-door sleepers). The unit of enumeration for housing characteristics was the main dwelling unit.

All persons in conventional households and institutions such as boarding schools and colleges were enumerated as scheduled within the seven days using the main (long) form, while the other categories such as hotels, travellers and out-door sleepers were strictly enumerated on the census night using the short forms.

Data Capture Methodology

During the 2009 Census, data capture was done using the Optical Character Recognition (OCR) process commonly referred to as the scanning method just like the 1999 Census. This mode of data capture was quite effective despite a few technological hitches which were resolved with the help of the U.S. Census Bureau technical assistance. The process had several stages which included: batching, scanning, Keying from Image (KFI) and Optical Character Recognition (OCR) and the library. Batching involved putting together a number of booklets from the same enumeration area and giving it a unique number for tracking purposes. Scanning was the process of electronically capturing the information from the questionnaires and maintaining it in the system for processing. KFI was the manual keying of the images that could not be recognized by the scanners due to various reasons. The characters that were not clear were done manually by the OCR team. All the captured data was then stored in the server, awaiting analysis.

Measurement

There are various methods of projecting population (mathematical, economic and cohort-component methods). Some are very sophisticated and rigorous while others are simple and less sophisticated. Identifying which projection model is optimal for a specific type of projection depends on several factors. Of crucial importance is whether the projections are to be carried out for larger geographical areas (e.g. projections at national level) where uncertainty is lower, or smaller areas (e.g. projections at county level) where migration makes future population developments more volatile and projections more difficult.

“The critical point to remember when choosing a projection method is that no single model or technique is better than other for all purposes. Rather, each has its strengths and weakness and must be evaluated according to its face validity, timeliness, cost, data requirements, ease of application, and other characteristics” (Skirbekk V. et al, 2007).

Cohort-component method

The most common tool in population projections is the cohort-component method. This method is superior to mathematical methods as it involves a separate analysis of the changes affecting each component of the population.

Cohort-component method is used to project the population forward into the future years. In this method, the components of population change (fertility, mortality, and net migration) are projected separately for each birth cohort. In populations where HIV prevalence is greater than one percent, the United Nations recommends that mortality be projected to include the impact of HIV and AIDS.

This method usually presents a set of scenarios chosen to represent plausible, possible or relevant future paths of fertility, mortality, and migration. Among the high, medium, and low scenarios of population projections generated by the cohort-component method, the medium variant is treated as being the ‘most likely’ outcome, since it gives a sense of neutrality and hence an apparent plausibility in future development.

The component method of projecting a population entails following each cohort of people of the same age throughout its lifetime according to its exposure to mortality, fertility, and

migration. Starting with a base population by age and sex, the population at each specific age is exposed to the chances of dying as determined by projected mortality levels and patterns by age and sex. Once the deaths are estimated, they are subtracted from the surviving population, and those remaining alive become older. Fertility rates are projected and applied to the female population in childbearing ages to estimate the number of births every year. Each cohort of children born is also followed through time by exposing it to the appropriate mortality rates. Finally, the component method takes into account net-migrants who are incorporated at each specific age. The whole procedure is repeated for each year of the projection period, resulting in the projected population by age and sex for each year.

With the requisite input information about the components of population change (including HIV) available, the cohort component method was used to project both the national and provincial populations.

Ratio method

The ratio method of population projection is found to be the most reliable method of projecting population at lower geographic levels when the necessary input information about the components of population change are not readily available. It is based on the ratio of the county population to that of the provincial population using the base population. After the ratio of the county to provincial population is obtained, assumptions are made on the future values of ratios. Once, the future values of ratios are fixed, the population of the county can be obtained by applying that ratio to the projected provincial population in that year.

Corresponding input information about the components of population change (including HIV) were not available at county level. Consequently, the ratio method was used to generate projected county populations based on the assumption that the share of county to the provincial population at the census time will remain constant throughout the projection period.

Assessment of the 2009 census data quality

Demographic data collection in Kenya and elsewhere is influenced with problems of administration and logistics. These give rise to coverage and content errors, which vary both in nature and magnitude from one country to another and one region to another. Coverage errors result from omission of certain pockets of the population, while content errors pertain to misreporting or misclassification of events. The errors lead to biases and distortion in the estimates based on such data.

Although all modern censuses collect information on age and sex of the population, the data often contain errors because some people do not know their true age and others do not report their age accurately. The distribution of a population by age and sex is one of the most basic types of information needed for future planning. Given the importance of the age structure with respect to social and economic characteristics, it is imperative that the information on the population by age and sex be as accurate as possible. For this reason, it becomes critical to evaluate the reported age and sex composition of the population before undertaking population projections.

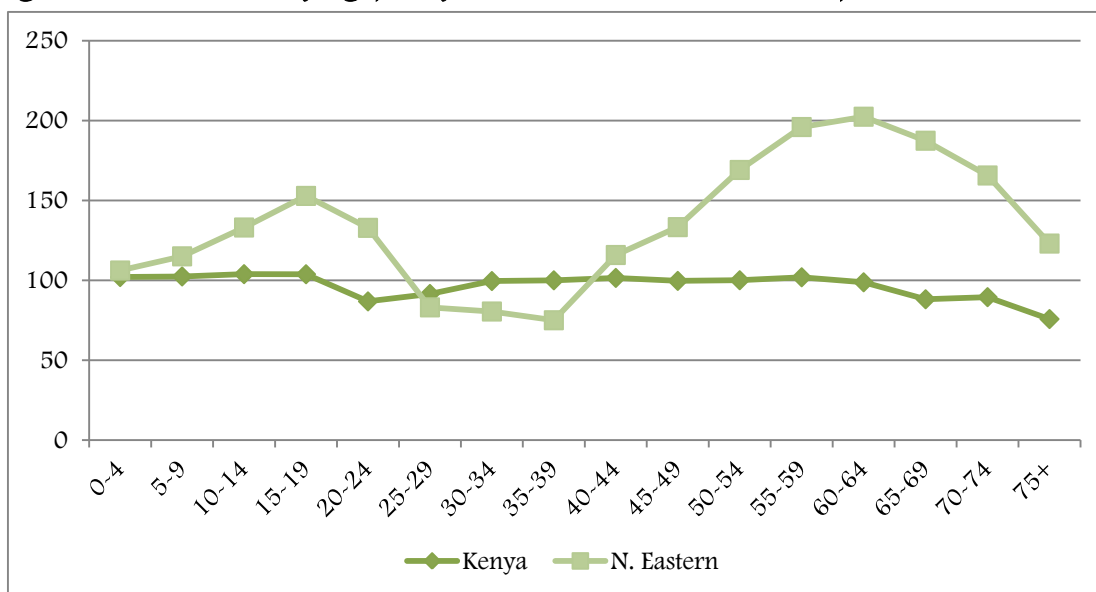

Coverage errors

Coverage errors may occur in various forms, namely: omitting a unit that should have been included; including a unit more than once; or including a unit that should not have been included. In spite of the fact that massive efforts are made in providing good training and up-to-date cartographic maps to the field staff, as well as introducing checks and controls throughout the fieldwork, such errors still occur. Consequently, any census data should be always checked for any inconsistencies as a result of such errors. Various techniques have been developed for checking for such inconsistencies, for example by use of sex ratios.

Sex ratios

Sex ratios are an analytical tool and are calculated by dividing the male population in a given age group by the female population in the same age group, multiplied by 100. The larger the abrupt departure of this ratio from values close to 100, the larger the possibility of errors in the data. All populations have more male than female births, and so the sex ratio at the early ages is expected to be slightly over 100. However, since mortality is usually higher for males than females, the sex ratio is reduced continuously up to the oldest ages. Sex Ratios below 100 denote under-coverage while those above 100 would imply double counting. Figure 1.1 depicts sex ratios for Kenya and North Eastern province.

Figure 1.1: Sex Ratios by Age, Kenya and North Eastern Province, 2009

The figure shows that on average, the sex ratio at national level is normal. On the other hand, sex ratio for North Eastern province indicates irregularities at all ages with a maximum sex ratio of 202 for those aged 60-64.

Content errors

One of the basic but vital information provided by a census is the age profile of the population. Population data in developing countries are often subject to age misreporting. Irregularities in the age distribution may be a result of a respondent's incorrect age declaration or the interviewer who estimates the age of a respondent who does not know his or her age. It is, therefore, important to evaluate the accuracy of the age distribution and correct for deficiencies wherever necessary. The principal approaches for evaluating age misreporting are digit preference and age ratios.

Digit preference

Digit preference or age heaping is a common error that occurs in age reporting. It is the result of deliberate mis-statement or ignorance of age on the part of the respondent. Irregularities in reporting of age can be detected by using various indices which detect digit preference at the terminal digits. By means of such indices, several methods have been developed to detect irregularities in reporting age. To quantify the magnitude of digit preference, the Myer's Index was used on the Kenyan data.

This index assesses digit preference in all the 10 terminal digits (0-9). Every one of the ten terminal digits takes 10 percent out of a 100. In an ideal situation where there is no digit preference, the terminal digit will score a total of 10 percent. A deviation from 10 percent shows either digit preference (a positive deviation value), or digit avoidance (a negative deviation value). Positive values indicate digit preference - that people prefer reporting their age ending with those digits. Digit preference, using Myers Index, for the 2009 census data is illustrated in Figure 1.2.

Figure 1.2: Digit Preference by Sex, Myers Index, Kenya, 2009

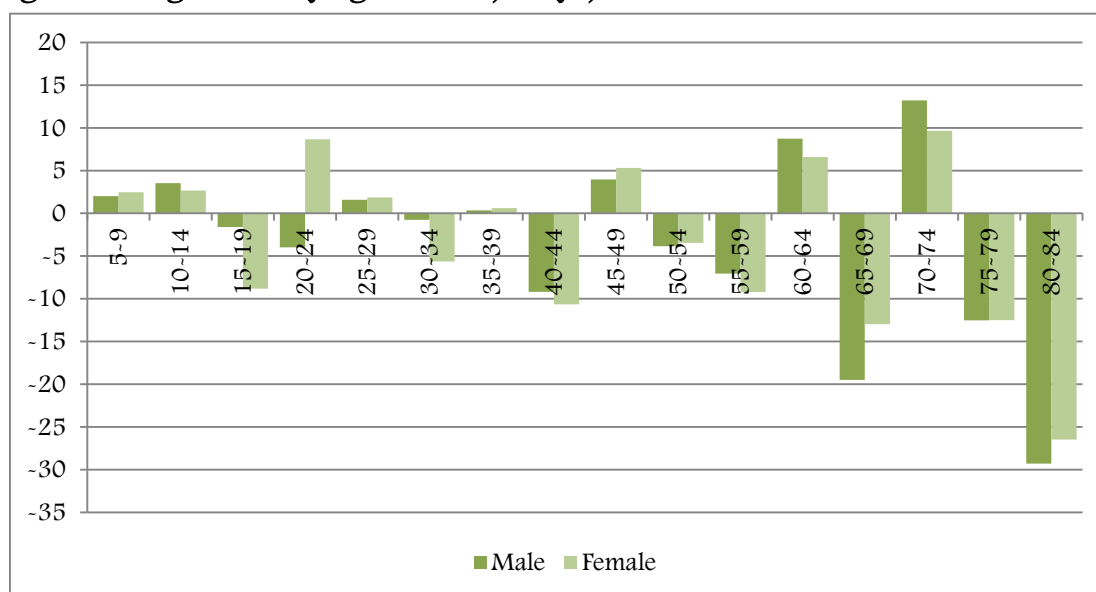

Terminal digits (0 and 5) were highly preferred with zero having the highest preference, more so by females. Most people avoided reporting age ending with digit 1 followed by digit 9 and thus shifted their ages to end with the most likely terminal adjacent digit zero.

Age ratios

Age ratios for 5-year age groups provide an alternative for detecting possible age misreporting. In a population where there is no age misreporting, age ratios are expected to be similar throughout the age distribution, and all of them should be close to a value of 100. As in the case of sex ratios, the larger the fluctuations of these ratios and the larger their departure from 100, the greater the probability of errors in the data. Figure 1.3 below shows age ratios by sex.

Figure 1.3: Age Ratios by Age and Sex, Kenya, 2009

The age-sex ratios in Figure 1.3 show fluctuations for both sexes but most prominent in older ages – among those aged 65 and above. Such fluctuations cannot be fully explained by demographic factors and were, therefore, attributed to the quality of the age-reporting arising from differential age shifting by sex and hence necessitating graduation of the reported age-sex distribution.

Age-sex accuracy index

The United Nations suggested a joint accuracy index to summarize the values of the age and sex ratios. Based on empirical analysis of the age and sex declaration in censuses from different developed and developing countries, the UN suggested that the age and sex structure of a population will be (a) *accurate* if the joint score index is under 20, (b) *inaccurate* if the joint score index is between 20 and 40, and (c) *highly inaccurate* if the index value is over 40. The Accuracy Index for the 2009 census was 23.7, which is fairly accurate, as it is on the lower scale of 20-40.

Time series of such indices become good indicators as to whether the quality of the population age and sex reporting is improving or deteriorating. Accuracy Indices from past censuses since 1979 are presented in Figure 1.4.

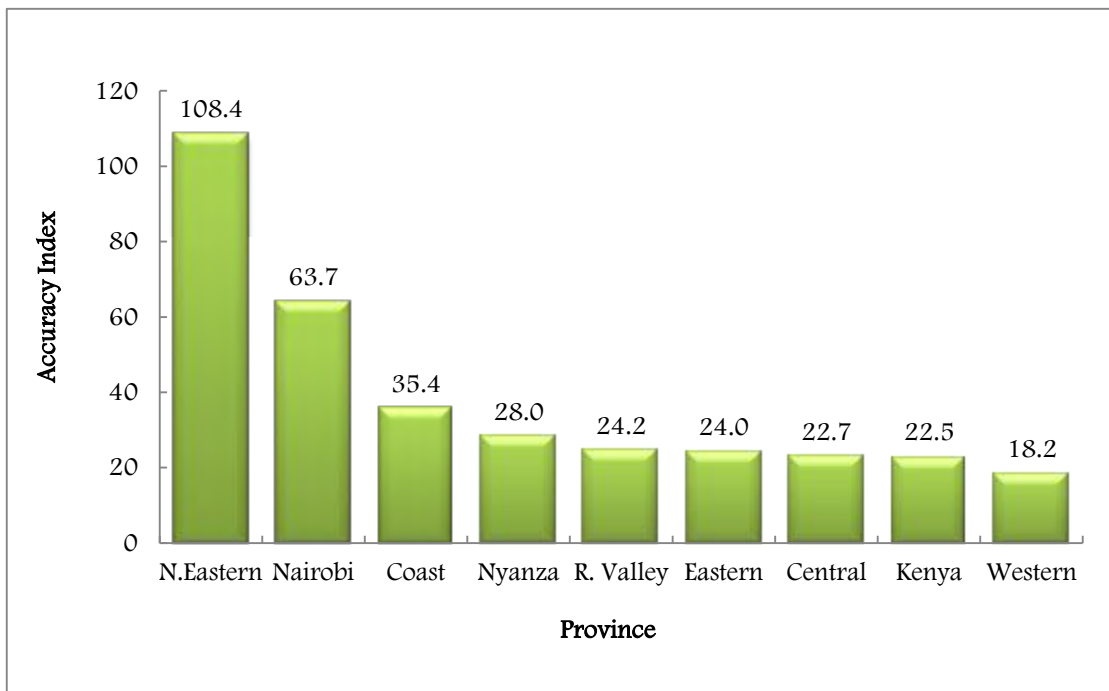

Figure 1.4: Accuracy Index, Kenya, 1979-2009

There has been some improvement in the Accuracy Index since 1979. So far, the 2009 census had the best Accuracy Index followed by the 1989 census, with the 1979 census recording the worst at 28.1.

A closer scrutiny of the Accuracy Index from the 2009 census reveals regional differentials by province. The Accuracy Indices by province are as indicated in Figure 1.5

Figure 1.5: Accuracy Index by Province, 2009

From the figure 1.5, North Eastern province reflects an index of 108 - denoting highly inaccurate reporting, followed by Nairobi province at 64. Among all provinces, only Western- with an index of 18, fell in the category of accurate reporting. The rest of the provinces had indices that placed them in the category of inaccurate.

North Eastern Province

Errors in the sex ratios and an accuracy index indicating extreme inaccuracy in reporting age and sex for North Eastern province noted above were useful cues to warrant a closer scrutiny on the quality of data for this province. This evaluation focuses on the population size, population growth rate, household size and net migration. Table 1.1 presents enumerated population, percentage change and growth rate between 1999 and 2009 Censuses.

Table 1.1: Enumerated Population, Percentage Change and Growth rate by Province, 1999-2009

Province	Enumerated population		1999-2009	
	1999	2009	% Change	Growth Rate
Kenya	28,686,607	38,610,097	34.6	3
Nairobi	2,143,254	3,138,369	46.4	3.8
Central	3,724,159	4,383,743	17.7	1.6
Coast	2,487,264	3,324,805	33.7	2.9
Eastern	4,631,779	5,668,123	22.4	2
N. Eastern	962,143	2,311,259	140.2	8.8
Nyanza	4,392,196	5,442,711	23.9	2.1
Rift Valley	6,987,036	10,006,805	43.2	3.6
Western	3,358,776	4,334,282	29	2.5

Among the provinces, it is only in North Eastern where the population enumerated in 2009 is more than double the enumerated population in 1999. This represents a high population change of 140 percent – which translates into an unprecedented annual growth rate of 8.8 percent. Such a growth rate of population in the province could only have been realized if there was large net in migration to the province.

The household size (the average number of persons per household) for the past two censuses by province is presented in Table 1.2. It is evident that the household size has declined in five provinces and remained constant in two provinces. However, data for North Eastern province reflects an increase of 11 percent in household size.

Table 1.2: Household Size by Census Year, 1999-2009

	1999	2009	% Difference 1999-09
	Kenya	4.5	4.3
Nairobi	3.3	3.1	-6.5
Central	4	3.5	-14.3
Coast	4.7	4.5	-4.4
Eastern	4.8	4.4	-9.1
N. Eastern	6.5	7.3	11
Nyanza	4.5	4.5	0
Rift Valley	4.7	4.6	-2.2
Western	4.8	4.8	0

Table 1.3 presents net migration by province from the 2009 Census. Clearly, North Eastern province was a net loser (negative value), hence failing to justify the reported high increase in the population size.

Table 1.3: Net Migrations by Province, 2009

	Out migrants	In migrants	Net migrants
Kenya	812,103	812,103	0
Nairobi	153,659	247,690	94,031
Central	109,998	135,115	25,117
Coast	42,010	67,850	25,840
Eastern	146,023	51,427	-94,596
N. Eastern	14,340	7,627	-6,713
Nyanza	107,218	65,580	-41,638
Rift Valley	133,945	192,110	58,165
Western	104,910	44,704	-60,206

In summary, there is clear evidence that data from North Eastern province reflect inconsistencies across the board: in population size; growth rate; age and sex structure, etc. Such inconsistencies have serious implications on population projections – hence the need for adjustment.

Adjusted population

Once inaccuracies in reporting are detected, the standard procedure as per the UN Principles and Recommendations is to adjust the population before embarking on projections. As a standard practice that has been adhered to in all the previous censuses in the country, the next step was to adjust the irregularities in reporting age in order to generate smoothed age-sex distributions. In turn, the resultant smoothed populations were then used to generate base populations for projection purposes.

Smoothed population

Smoothing techniques have frequently been used for adjusting data for age misreporting. Most of these techniques involve the application of a formula to the original data. The smoothing of age distributions by such formulas usually gives acceptable results. However, these formulas produce only a light smoothing, and if the irregularities are so large, then the population data will require a "stronger" smoothing procedure.

For the 2009 data, these smoothing procedures were used to adjust for coverage and content errors detected in the population data. Since irregularities were not severe in the seven provinces (Nairobi, Central, Coast, Rift Valley, Eastern, Nyanza and Western), light smoothing was applied in adjusting data from these provinces. However, highly inaccurate reporting detected in data for North Eastern province necessitated application of strong smoothing techniques. The smoothed populations of all the provinces were cumulated to yield the national smoothed population. Figure 1.6 shows the national enumerated and smoothed population by age. Table 1.4 presents the 2009 adjusted Population by Sex and province. Similar detailed information by constituency is presented in Appendix 1.1.

Figure 1.6: Reported versus Smoothed Population, Kenya, 2009

Table 1.4: 2009 Enumerated/Adjusted Population Census by Sex and Province

	2009 Enumerated			2009 Adjusted		
	Male	Female	Total	Male	Female	Total
Kenya	19,192,458	19,417,639	38,610,097	18,674,184	19,050,666	37,724,850
Nairobi	1,605,230	1,533,139	3,138,369	1,603,063	1,531,198	3,134,261
Central	2,152,983	2,230,760	4,383,743	2,151,859	2,229,892	4,381,751
Coast	1,656,679	1,668,628	3,325,307	1,655,326	1,667,539	3,322,865
Eastern	2,783,347	2,884,776	5,668,123	2,781,639	2,883,417	5,665,056
North Eastern	1,258,648	1,052,109	2,310,757	726,751	667,615	1,394,366
Nyanza	2,617,734	2,824,977	5,442,711	2,616,416	2,823,814	5,440,230
Rift Valley	5,026,462	4,980,343	10,006,805	5,023,920	4,978,369	10,002,289
Western	2,091,375	2,242,907	4,334,282	2,115,210	2,268,822	4,384,032

Base Population

The construction of the base populations for projection purposes entailed adjusting the smoothed populations pertaining to 24/25 August 2009 to those referring mid-year 2010. Consequently, the start year of the projections is 2010 while the terminal year is 2030. The resultant national and provincial base populations are presented as Appendix 1.2.

1.4 Definitions of key concepts

Age misreporting: This is where a person states his/her age wrongly by giving a value which is less or higher than actual, either intentionally or unintentionally.

Age ratio: It is the proportion of population in a given age group to its adjacent age groups, that is the successive and the predeceasing age groups.

Age-sex accuracy index: It is an index that combines both the sex ratio and the age ratio for both male and females to develop a joint score

Base population: It is the starting population on which future population projections are speculated to increase from.

Content errors: These are errors in the characteristics of the persons counted, resulting from incorrect reporting or recording or from failure to report.

Coverage errors: These are non-sampling errors that result from omitting a unit that should have been included, including a unit more than once, or including a unit that should not have been included

De-facto: This is the collection of basic social, demographic and economic data for all people who will have spent a specified night in the area. It is like taking a snapshot of the people in the area on that census night. Practically, the enumeration of people is done at household level or institution level (like a dormitory in a school, a ward in a hospital, a cell in a prison, etc.) At this level a de facto census involves counting people who will have spent a specified night in a household or an institution. Special categories of people like those who will have spent the night fishing or working as watchmen are assumed to have spent the specified night in their respective usual households.

De jure: This is the collection of basic social, demographic and economic data for all the people who usually reside in the country. It will exclude visitors from other countries and include residents who will be outside the country at the time of enumeration.

At household or institution level the de jure census includes only the usual members. The problem with the de jure census is to define the "*usual member*" of a household or an institution. A common definition of a "usual member" of a household as used in the Kenya National Sample Survey and Evaluation Programme and censuses is "a person who has continuously stayed in the household for 6 or more months, during the last 12 months".

Expectation of life: It is an estimate of the average number of additional years a person could expect to live if the age specific death rates for a given year prevailed for the rest of his/her life. This can be derived for either male or female and in most populations is slightly higher for females than for males. It is commonly referred to as life expectancy at birth, denoted by $e (0)$. Life expectancy can be derived at any other age based on the current death rates.

HIV prevalence: Is the percentage of people who have been infected by HIV in a population at a particular point in time.

Net migration: It is the difference between the number of in-migrants and the number of out-migrants.

Population projection: It is an estimate of future population by considering changes in a population due to fertility (births), mortality (deaths) and migrations.

Population pyramid: A diagram showing the comparison of a human population by sex and age at a given time, consisting of a pair of histograms, one for each sex, laid horizontally in ascending order of age groups with a common base. The diagram is intended to provide a quick overall comparison of the age and sex structure of the population.

Sex ratio: The number of males to the number of females usually expressed as a percentage.

Smoothed population: It is the population that has been adjusted for errors on age due to misreporting to give a more fitting demographic pattern.

Total fertility rate: It is the average number of children born alive to a woman during her lifetime if she were to bear children at each age in accordance with the prevailing age-specific fertility rates. It is obtained by summing up all age-specific fertility rates for each year of the childbearing span.

Chapter 2-Component Projections

Assumptions about future fertility, mortality, and net migration, as well as HIV prevalence, that drive population projections were based on analysis of historical demographic trends for Kenya with regard to these components of population change, which were then used to project the population into the future. Note that projecting HIV prevalence, which is then incorporated into the projections, involves a separate methodology.

2.1 Fertility Projections

Fertility in this report refers to the number of children given birth to by a woman in her lifetime. Births contribute more than any other demographic event to the country's population growth. Future fertility paths are extremely important for future fertility trends. In the long run, the level of fertility has the greatest effect on population growth because of its multiplier effect: additional children born today will have additional children in the future. Fertility assumptions are usually expressed as period fertility, i.e., total fertility rate (TFR) - the number of children a woman expects to have after going through her reproductive life. Fertility projections are made by projecting the course of the TFR over time, and translating this total fertility rate into age-specific fertility rates. In general, the projection of TFR is divided into assumptions regarding an assumed eventual fertility level, and the path taken from the current to the eventual level. Both the assumed eventual fertility level and projected pace of fertility change are important to determining trends in population size and age structure.

Four historical estimates of fertility – the 1999 and 2009 censuses, and the 2003 and 2008/09 Kenya Demographic and Health Survey (KDHS) estimates – together with the 2009 census estimates were used as inputs. At national level, it was assumed that the decrease in TFR would continue till the end of the projection period. The TFR was, therefore, assumed to decline from 4.7 in 2010 to 4.6 in 2015, then to 4.4 in 2020, then to 4.3 in 2025, and eventual reach 4.1 in 2030. Similar fertility assumptions were made for each province using national and provincial estimates of TFR from the 2009 Census as inputs.

2.2 Mortality Projections

Mortality projections are based on projecting future expectation of life at birth for males and females, defined as the average lifespan of a child born today if current age-specific mortality levels were held fixed in the future. Expectation of life at birth was assumed to increase from 58.5 for males and 61.6 for females in 2010 to 65.3 and 69.5 in 2030 respectively. This was based on the fact that both the 2008/09 KDHS and the 2009 Census had shown improvement in infant and child mortality.

Adjustment due to HIV

Non-AIDS mortality

The 2008/09 KDHS infant and child mortality estimates were used to subtract the estimated AIDS-only mortality from the KDHS mortality estimates (which include AIDS), to

obtain non-AIDS life tables for 2004, the reference year of the estimates. The resultant values of non-AIDS expectation of life at birth were projected to 2030.

Similarly, the 2008/09 KDHS infant and child mortality estimates were used for projecting mortality at provincial level. Since the KDHS report does not provide mortality estimates by sex at provincial level, the infant and child mortality estimates had to be split by sex. The process involved estimation of sex ratio at birth using national estimates of infant and child mortality, and splitting the provincial estimates using the implied sex ratio.

The estimated infant and child mortality values for each province by sex using this process were used to estimate the non-AIDS age-specific mortality rates. This was achieved by subtracting the estimated AIDS-only mortality from the KDHS mortality estimates (which include AIDS), to obtain non-AIDS life tables for 2004, the reference year of the estimates. Once more, the resultant values of non-AIDS expectation of life at birth were projected to 2030 for each province.

AIDS-only mortality

The AIDS-only age-specific mortality rates for 2010 to 2014 from the National AIDS Control Council (NACC) Spectrum file (updated since March 2011 workshop in Johannesburg) were used as the input. To project these values to 2030, an adjusted exponential average growth rate, based on change in mortality between 2009 and 2014 for each specific 5-year age group, was used. The adjusted exponential growth rate took into account the two adjacent age groups, thereby mitigating wide fluctuations in rates that might be present if only one age group was utilized. This is akin to taking a three-year moving average. The result was a continued decline in AIDS-only mortality in future years. By 2030, these computations indicate that there will be minimal impact of HIV and AIDS on the Kenyan population. The AIDS-only age-specific mortality values were then combined with the non-AIDS mortality rates to produce a set of mortality rates that include AIDS.

In order to obtain the AIDS-only age-specific mortality values for each province, the ratio of the provincial HIV prevalence to the national HIV prevalence as measured in the 2008/2009 KDHS was used. This ratio was then applied as an adjustment factor by multiplying this factor by the national-level age-specific mortality rates to obtain AIDS-only age-specific mortality rates for each province from 2010 to 2030. Similar to the national projection, the AIDS-only age-specific mortality values for the provinces were combined with the non-AIDS mortality rates to produce a set of mortality rates that include AIDS for each province.

2.3 Migration Projections

Migration flows fluctuate strongly and may depend on a large range of factors, including business cycles in both the sending and receiving areas, family connections, cost of migration, destination's reputation, attitudes to immigrants, etc. Migration is strongly influenced by policies. This contrasts with mortality and fertility where the impact of policy is much less evident. Migration regulations and practices are difficult to foresee, which makes migration the possibly most difficult demographic component to predict.

International migration

International migration is the most difficult growth component to assess because data are inadequate. Previous censuses in Kenya have recorded very low volumes of this type of migration – hence an insignificant factor in population change. The 2009 census also recorded a low rate (less than 1%) of international migration, and therefore not incorporated into the national population projections.

Internal migration

Based on responses in the 2009 census to the question on place of residence 12 months prior to the census date, migration between provinces was accounted for, and at same time, ensuring that the sum of all provincial net internal flows by age and sex must be zero. Caution was exercised so as to exclude migration between districts belonging to the same province. The average of the net migration figures in the last three censuses (1989, 1999 and 2009) was used to represent internal migration at the provincial level. It was assumed that these averages would remain constant for the entire projection period.

Chapter 3~Population Projections

3.1 National Population Projections

The rural-urban population projection (RUP) program by the US Census Bureau was used for projecting the population. This program uses the cohort component method for projecting the population by age and sex. The projection is made following cohorts by single years of age. Using interpolated values of central death rates from life tables, RUP estimates the number of deaths and subtracts them from each cohort. It also takes into account internal and international migration. Every year, births are estimated using fertility rates and the female population in reproductive ages. The annual number of births constitutes new population cohorts that are followed through in the future. In summary, this method follows a group of people in an age group at a point in time as they survive and become older, while accounting for the three demographic components of change (births, deaths and migration).

The projection results under the above set of assumptions are shown in Table 3.1 and Figure 3.1. Starting with a population of 38.5 million in 2010, it is projected to reach 44.2 million by 2015, 50.3 million by 2020, 57.0 million by 2025, and 63.9 million by 2030. Without the effect of HIV and AIDS, the projected population would have reached 66.5 million by 2030. Detailed population projections by age and sex appear in Appendix 3.1.

Table 3.1: Projected Population, Kenya, 2010-2030

				Millions
Year	Male	Female		Total
2010	19,047	19,426		38,474
2011	19,584	19,961		39,545
2012	20,137	20,515		40,652
2013	20,707	21,085		41,793
2014	21,290	21,671		42,961
2015	21,887	22,270		44,157
2020	24,996	25,323		50,319
2025	28,270	28,729		56,999
2030	31,668	32,192		63,860

Figure 3.1: Projected Population, Kenya, 2010-2030

3.2 Provincial population projections

The rural-urban population projection program was also used for projecting the population at provincial level. Once all the provincial population projections had been generated, the next challenge was to ensure that the projections were both internally consistent and consistent with the national projection. Regional population projections, when summed to obtain the population for the whole country, may produce some inconsistent trends of mortality and fertility at the national level. To avoid this, it has been suggested to make first a population projection for the whole country to serve as a control total for the sum of the regions.

Consequently, the next step was to sum up all the individual provincial projections to get a national projection and adjust the sum of the projected provincial populations to be consistent with the projected national population. The projected national and the aggregated provincial populations were first compared and the resultant differences noted. After this initial comparison, the projected provincial populations were then adjusted to be consistent with the projected national population. The adjusted provincial population with AIDS and without AIDS projections were aggregated to confirm that the aggregated national totals matched the national projection.

Projection results for all provinces are illustrated in Table 3.2 and Appendix 3.2. All provinces are projected to grow, none of them experiencing population decline at any point. Provincial rankings by population size are not expected to change - Rift Valley is expected to remain the largest province and North Eastern the smallest. However, Nairobi is expected to experience the highest rate (4.7%) in its population increase – from 3.1 million

in 2010 to 8.1 million in 2030. During the same period, Eastern and Western provinces are expected to experience the lowest rates (0.9% and 1.7% respectively) in their population increase. This can be explained largely from the fact that these two provinces were net losers of migrants in all age groups in all the three immediate censuses.

Table 3.2: Projections by Age, Sex and Province, 2010-2030

Province	2010	2011	2012	2013	2014
Kenya	38,473,893	39,545,118	40,651,744	41,792,563	42,961,187

Western	4,811,630	5,240,432	5,708,148	6,220,337

3.3 County population projections

The county population projections were carried out using the constant ratio share method, instead of the component projection method. This is because fertility, mortality, and migration data were not available at the county level. To account for any changes in the proportionate shares over the years, the averages of the 1989, 1999 and 2009 proportionate shares of the county populations to their respective provincial populations were computed. Based on these average shares, county population projections were generated out of the projected provincial populations. While a summary of the county population projections are presented in Table 3.3, detailed projections by age, sex and county are given in Appendix 3.3.

Table 3.3: Population projections by county, 2010-2030

Province	2010	2011	2012	2013	2014	2015	2020	2025	2030
Kenya	38,473,893	39,545,118	40,651,744	41,792,563	42,961,187	44,156,577	50,319,253	56,998,894	63,859,547

The expected rate of increase in the projected populations between 2010 and 2030 is expected to greatly vary by county. Ranked by their population sizes, Nairobi County is expected to continue to be the most populous throughout the projection period. However, none of the next nine most populous counties are expected to maintain their ranks in the 20-year projection period. Among the counties whose ranks are expected to improve include: Nakuru (from 4 to 2); Mombasa (from 14 to 7); and Uasin Gishu (from 16 to 9). On the other hand, ranks of some of them will decline: Kakamega (from 2 to 4); Bungoma (from 5 to 6); Meru (from 6 to 10); Machakos (from 9 to 21); and Kitui (from 10 to 24). Table 3.4 portrays the rankings of the top ten most populous counties in both 2010 and 2030.

Table 3.4: Projected Population of the Top Ten Most Populous Counties, 2010 and 2030

Rank	Population		Population	
	County	2010	County	2030
1	Nairobi	3,144,918	Nairobi	8,105,962
2	Kakamega	1,698,576	Nakuru	3,108,708
3	Kiambu	1,660,366	Kiambu	2,390,661

10	Kitui	1,035,831	Meru	1,675,867

3.4 Sectoral population projections

To ease planning processes, it becomes necessary to project some special population groups. Projections of school-age population, labour force, constituencies and households are included in this monograph.

School-age population projections

School-age population projections corresponded to the three educational levels: pre-school - population age 3-5 years; primary - population age 6-13 years; and secondary - population age 14-17 years. The results of the projected school-age population by province are depicted in Table 3.5.

Table 3.5: Projected School-age Population by Province, 2010-2030

Province	Age	2010	2011	2012	2013	2014	2015	2020	2025	2030

	14-17	977,013	1,008,333	1,038,756	1,068,317	1,097,707	1,127,323	1,271,191	1,405,449	1,726,583
Western	3-5	447,368	450,773	453,712	455,572	472,268	489,706	528,300	550,890	575,910
	6-13	1,044,732	1,057,292	1,069,210	1,080,619	1,091,474	1,101,674	1,206,489	1,322,585	1,387,671
	14-17	433,057	439,117	445,969	454,020	462,505	470,336	501,048	539,125	611,424

Nationally, children of pre-school age are expected to increase from 3.5 million in 2010 to 5.5 million in 2030; those of primary school age from 8.2 million in 2010 to 13.0 million in 2030; while those of secondary school age from 3.5 million in 2010 to 5.7 million by 2030.

At regional level, the rate of increase in the projected school-age population within the projection period is expected to vary: Nairobi province is expected to take lead with its pre-school age population increasing at about 5.0 percent and both the primary school age and secondary school age populations increasing by about 6.0 percent; the three components of school-age populations in Coast and Rift Valley provinces are expected to increase by about 3.0 percent; Eastern province is expected to experience the least rate of increase in the three components – at between 0.2 and 0.5 percent. Details of the projected school-age populations by sex and province are shown in Appendix 3.4.

Labour Force Projections

The base population in the labour force (those aged 15-64 years) was projected as shown in Table 3.6.

Table 3.6: Projected Labour Force by Province, 2010-2030

Province	2010	2011	2012	2013	2014
Kenya	20,856,610	21,535,844	22,235,990	22,957,996	23,700,605

Western	2,398,491	2,644,615	2,910,362	3,266,856

The pool of potential workers at national level is expected to increase from 20.9 million in 2010 to 37.8 million in 2030. Regional variations in the projected labour force indicate that Rift Valley province is expected to contribute about 30.0 percent of the national total followed by Nairobi and Nyanza provinces at 14.0 percent and 13.0 percent respectively. As shown in Figure 3.2, North Eastern province is expected to continue its minimal contribution at 3.0 percent.

Figure 3.2: Size of Projected Labour Force by Province, 2030

Constituency population projections

Table 3.7 summaries the projected population of the top ten most populous and ten least populous constituencies. Barring any boundary changes, Embakasi is expected to maintain the first position as the most populous constituency in the country followed by Kasarani. While Lang’ata is expected to move from the tenth to third most populous constituency by 2030, Juja is expected to lose out from position 3 to 13. On the other end of the scale, Lamu East is expected to continue as the least populous constituency in the country followed by Isiolo South constituency. Detailed population projections by age and sex are presented in Appendix 3.5.

Table 3.7: Projected Population by the Ten Most and Least Populous Constituency, 2010 and 2030

Constituency	2010		2030	
	Population	Rank	Population	Rank
Embakasi	927,420	1	2,308,052	1
Kasarani	525,681	2	1,334,497	2
Juja	497,748	3	701,591	13

Lamu East	19,238	210	36,098	210

Household projections

Introduction

Estimates of future numbers of households are of great importance to planners and policy analysts in governmental, business, nonprofit, and academic organizations since the household is the unit of consumption of durable goods. The household serves as a basic unit of housing demand since it is a unit of common dwelling. Secondly, a number of indicators for national monitoring and evaluation system for Vision 2030 and the MDGs, particularly at sub-national level, are dependent on knowing the total number of households.

Projection methodology

This section presents the number of future households at national and provincial levels. Several methods of household projections exist. The simplest being the use of headship rates and its extensions. This is simply the projection of percent distribution of population by sex, age and marital status, and of headship rates. It is an extrapolation method outlined in the UN Manual VII (UN, 1973). Extensions include the use of the modified exponential given by:

$$h^s(m, x, t+k) = 1 - [1 - h^s(m, x, t-n)] \times \left[\frac{1 - h^s(m, x, t)}{1 - h^s(m, x, t-n)} \right]^{\frac{(t+k)-(t-n)}{n}}$$

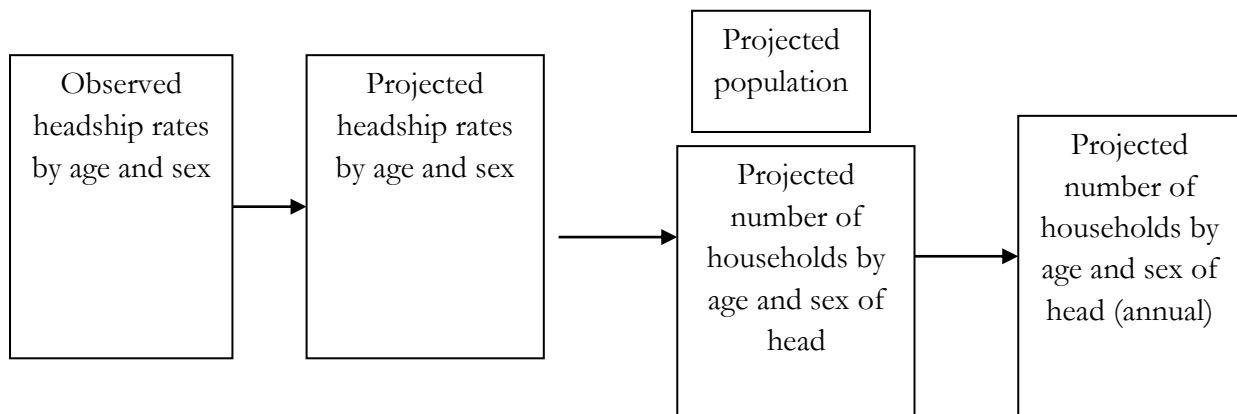

or

$$h^s(m, x, t+k) = h^s(m, x, t-n) \times \left[\frac{h^s(m, x, t)}{h^s(m, x, t-n)} \right]^{\frac{(t+k)-(t-n)}{n}} \text{ -----}$$

Where,

$h^s(m, x, t)$ indicates headship rate specific for sex s , marital status m , age x and year t ,
 $h^s(m, x, t+k)$ denotes headship rate specific for sex s , marital status m , age x and year $t+k$,
and
 $h^s(m, x, t-n)$ is headship rate specific for sex s , marital status m , age x and year $t-n$.
 n in this equation marks the base period between two census years.

For the sake of simplicity, marital status will be omitted and the simple framework is as follows

Projected headship rates

The key input to projecting households is the projected household headship rates. This is because headship rates are seem to be much less sensitive to variations in reproduction regimes compared to, say, population size and age structure. The stability of headship rates in human populations also provides a rationale in support of the headship rates method. Figures 3.3a and 3.3b show the projected proportions of heads of households to 2020 by sex. The male patterns reach a peak by middle age groups while the female rates are almost in a straight line. However, the headship rate method has also its short comings. Anomalies in data can make some rates go beyond 100 percent as in some provinces (see Appendix 3.5). Sometimes the projections at the sub-national level may fail to add up to the national projections. These need to be corrected and adjusted so that the total at the sub-national is the same as the overall national total.

Figure 3.3a: Projected male headship rates

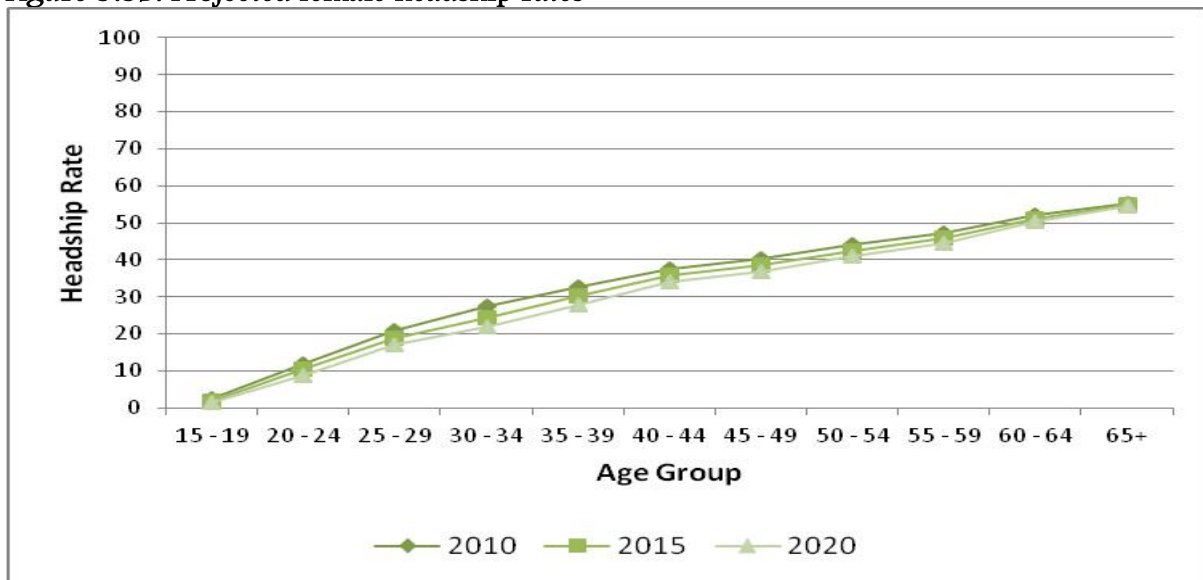

Figure 3.3b: Projected female headship rates

In order to obtain the expected number of household heads by sex, the projected rates are multiplied by the projected population in the respective age group by sex and dividing by 100 since the rates are multiplied by 100. The total number of households headed by age of individuals is obtained by adding the household heads for males and females by age. The sum of all household heads for each year constitutes the expected number of households.

Projected number of households

Table 3.8 shows the projected number of households by province. It shows that by 2015, there will be approximately 12.0 million households and about 14.0 million households by 2020. Nairobi, which is entirely urban, will require nearly 2 million houses to host its population by 2020.

Table 3.8: Projected Number of Households by Province

Province	2010	2011	2012	2013	2014	2015	2020
Kenya	10,101,936	10,520,571	10,722,709	11,244,000	11,411,350	12,026,122	13,920,373

Chapter 4-Summary, Conclusion and Recommendations

4.1 Introduction

This volume summarizes various components of population projections based on the 2009 Kenya Population and Housing Census. Population projections give an indication of what the future population would be if certain likely rates of fertility, mortality and migration were to apply. The projected size, composition and distribution of the population at different geographic units and points in time form a rational basis to gauge the primary needs of the Kenyan population.

4.2 Summary and Conclusions

Methodology

With the requisite input information about the components of population change (fertility, mortality - including HIV, and migration) available, the cohort component method was used to project both the national and provincial populations. The ratio method of population projection was used at the county and constituency levels where the necessary input information about the components of population change were not readily available.

Assessment of the 2009 census data quality

There were no serious irregularities in sex ratios at national level. However, there was a significant departure at provincial level, especially in North Eastern province. There were irregularities in reporting sex at all ages in this province with a maximum sex ratio of 202 for those aged 60-64.

Like in past censuses, terminal digits (0 and 5) were highly preferred with zero having the highest preference, more so by females. Most people avoided reporting age ending with digit 1 followed by digit 9 and thus shifted their ages to end with the most likely terminal adjacent digit zero.

Fluctuations in age-sex ratios were evident for both sexes but most prominent in older ages – among those aged 65 and above. Such fluctuations were attributed to the quality of the age-reporting arising from differential age shifting by sex.

The joint accuracy index summarizes the values of the age and sex ratios. The Accuracy Index for the 2009 census was 23.7, which is fairly accurate, as it is on the lower scale of 20-40. Comparatively, the 2009 census had the best Accuracy Index followed by the 1989 census, with the 1979 census recording the worst at 28.1. Once again, North Eastern province reflects *an index of 108 - denoting highly inaccurate reporting, followed by Nairobi province (64) in* this category. Only Western province – with an index of 18 – fell in the category of accurate reporting. The rest of the provinces had indices that placed them in the category of inaccurate.

Fertility projections

At both national and provincial levels, it was assumed that the decrease in TFR would continue till the end of the projection period. For example, the TFR was assumed to decline

from 4.7 in 2010 to 4.1 in 2030. Similar fertility assumptions were made for each province using national and provincial estimates of TFR from the 2009 Census as inputs.

Mortality projections

Mortality projections were based on projecting future expectation of life at birth. Expectation of life at birth was assumed to increase from 58.5 for males and 61.6 for females in 2010 to 65.3 and 69.5 in 2030 respectively. This was based on the fact that both the 2008/09 KDHS and the 2009 Census had shown improvement in infant and child mortality.

The AIDS-only age-specific mortality rates from the National AIDS Control Council data were used as the input in projecting the effect of AIDS. The result was a continued decline in AIDS-only mortality in future years. For example, by 2030, these computations indicate that there will be minimal impact of HIV and AIDS on the Kenyan population.

Migration projections

Like in previous censuses, Kenya continues to record very low volumes of international migration (less than 1%) – hence an insignificant factor in population change, and therefore not incorporated into the national population projections.

The average of the net migration figures in the last three censuses (1989, 1999 and 2009) were used to represent internal migration at the provincial level. It was assumed that these averages would remain constant for the entire projection period.

National population projections

The projection results indicate that the national population is expected to increase from 38.5 million in 2010, then to 44.2 million by 2015, 50.3 million by 2020, 57.0 million by 2025, and eventually reach 63.9 million by 2030.

Provincial population projections

Population in all provinces is projected to continuously grow throughout the projection period. Provincial rankings by population size are not expected to change - Rift Valley is expected to remain the largest province and North Eastern the smallest. However, Nairobi is expected to experience the highest rate (4.7%) in its population increase – from 3.1 million in 2010 to 8.1 million in 2030. During the same period, Eastern and Western provinces are expected to experience the lowest rates (0.9% and 1.7% respectively) in their population increase. This can be explained largely from the fact that these two provinces were net losers of migrants in all age groups in all the three immediate censuses.

County population projections

Ranked by their projected population sizes, Nairobi county is expected to continue to be the most populous throughout the projection period. However, none of the next nine most populous counties are expected to maintain their ranks in the 20-year projection period. Among the counties whose ranks are expected to improve include: Nakuru (from 5 to 2); Kiambu (from 4 to 3); Mombasa (from 14 to 7); and Uasin Gishu (from 16 to 9). On the other hand, ranks of some of them are expected to decline: Kakamega (from 2 to 4); Bungoma (from 3 to 5); Meru (from 6 to 10); Machakos (from 9 to 21); and Kitui (from 10 to 24).

School-age population projections

Nationally, pre-school age population is expected to increase from 3.5 million in 2010 to 5.5 million in 2030; those of primary school age from 8.2 million in 2010 to 13.0 million in 2030; while those of secondary school age from 3.5 million in 2010 to 5.7 million by 2030.

At regional level, the rate of increase in the projected school-age population within the projection period is expected to vary: Nairobi province is expected to take lead with its pre-school age population increasing at about 5.0 percent and both the primary school age and secondary school age populations increasing by about 6.0 percent; the three components of school-age populations in Coast and Rift Valley provinces are expected to increase by about 3.0 percent; Eastern province is expected to experience the least rate of increase in the three components – at between 0.2 and 0.5 percent.

Labour Force Projections

The pool of potential workers at national level is expected to increase from 20.9 million in 2010 to 37.8 million in 2030. Regional variations in the projected labour indicate that Rift Valley province is expected to contribute about 30.0 percent of the national total followed by Nairobi and Nyanza provinces at 14.0 percent and 13.0 percent respectively. North Eastern province is expected to continue its minimal contribution at three percent.

Constituency population projections

If constituency boundaries were to remain unchanged, Embakasi and Kasarani are expected to be the top two most populous constituencies, while Lamu East is expected to continue as the least populous constituency in the country followed by Isiolo South constituency.

Household projections

At national, the projected number of households is expected to rise from 10.1 million in 2010 to 12.0 million by 2015, and approximately to 14.0 million households by 2020. At provincial level, Nairobi, which is entirely urban, will require nearly 2 million houses to host its population by 2020.

Recommendations

Based on the experiences of projecting the population at different levels and through the twenty year span, a few recommendations emerged as articulated below.

Quality of census data remains a key area of focus in future censuses. It is recommended that all critical aspects be addressed at different stages of census management: design of questionnaire (maintain the bare minimal of questions); publicity (pointing out various data quality issues, especially those associated to specific regions); training (as a useful forum to improve data quality); field coordination (for quality assurance).

Much as international migration was insignificant in projecting population at national level, the volume and rate of immigration were not clearly established. As well, projecting urban population was hampered due to lack of data on rural-urban migration. Consequently, it is recommended that the questionnaire should clearly capture issues on rural-urban migration and also Kenyans in the diaspora.

With increasing demand for accurate population projections at the county level, population census may not be the most appropriate option as a source for such data – hence the need to explore other viable options. In this regard, it is recommended that counties be advised to invest in improving systems that will serve as sources of relevant data to their needs. These will include baseline surveys, vital registration systems, etc.

Given that the school-age population is expected to increase at an average annual rate of slightly above two percent, it is imperative upon the relevant ministries to plan accordingly such that the supply side is not overwhelmed by the demand. This kind of planning will positively contribute to the attainment not only of the national goals on education, but also in achieving MDG 2.

The projected labour force is expected to continue increasing at an average annual rate of about three percent. If this group of potential workers is not well catered for, it could be a potential source of different social ills, including civil unrest and increased crime. It is, therefore critical that relevant ministries explore modalities for increased job creation both in the formal and informal sectors.

World over, it is generally agreed that population projections should always be treated as provisional – given that the assumptions used might not materialize. It is, therefore recommended that regular reviews of the projections be undertaken whenever new pieces of data become available.

Contributors to the 2009 Kenya Population and Housing Census Monographs

Name and Institution	Role
A. K. M. Kilele Director General Kenya National Bureau of Statistics	Overall Coordinator
Mr. Macdonald G. Obudho Ag. Director, Population and Social Statistics Kenya National Bureau of Statistics	Administrative Coordinator
Mr. Michael M. Musyoka Kenya National Bureau of Statistics	Activity Coordinator & Fertility Author/ Editor
Mr. Robert C. B. Buluma Kenya National Bureau of Statistics	Disability author/ editor
Mr. Andrew A. Imbwaga Kenya National Bureau of Statistics	Mortality/Population Dynamics author/ editor
Mr. Robert Nderitu Kenya National Bureau of Statistics	Labour Dynamics author / editor
Mr. Godfrey O. Otieno Kenya National Bureau of Statistics	Education/ Editor
Mr. Charles Obiero Kenya National Bureau of Statistics	Education author
Ms. Rosemary Uside Kongani Kenya National Bureau of Statistics	Gender Dimensions author
Ms. Vivian M. Nyarunda Kenya National Bureau of Statistics	Migration /Urbanization author
Mrs. Emma A. Odhiambo Kenya National Bureau of Statistics	Kenya Population Atlas author
Mr. Mutua Kakinyi Kenya National Bureau of Statistics	Data Processing
Mr. Peter Nyongesa Ministry of State for Planning, National Development and Vision 2030	Data Processing
Mr. Paul Waweru Kenya National Bureau of Statistics	Data Processing/ Formatting
Mr. Bernard D. Obasi Kenya National Bureau of Statistics	Data Processing
Dr. Alfred Agwanda University of Nairobi	Lead Consultant ~ Demographic Monographs/ author: Population Dynamics & Household and Family Dynamics
Mr. John Thinguri Mukui Nairobi	Lead Consultant – Socioeconomic Monographs
Prof. Elias H. O. Ayiemba University of Nairobi	Consultant/ Fertility and Nuptiality author
Dr. Anne Khasakhala University of Nairobi (Consultant)	Consultant/ Mortality author
Mr. George Odipo University of Nairobi (Consultant)	Consultant/ Migration author
Mr. Ben O. Jarabi University of Nairobi	Population. Projections author

Dr. Samuel Owuor University of Nairobi	Consultant/ Urbanization author
Mr. Olum Gondi Nairobi	Consultant/ Labour Dynamics author
Dr. Owiti A. K'Akumu Nairobi	Consultant/ Housing Conditions, Amenities and Household Assets author
Dr. Abagi Okwach Nairobi	Consultant/ Education author
Mr. Michael K. Letwatt Nairobi	Consultant/ Data Processing
Mr. Raphael O. Owako Ministry of Public Health and Sanitation	Disability author
Mr. Thomas Ogutu Ministry of Housing	Housing Conditions, Amenities and Household Assets author
Ms. Leah Kiura Private Consultant, Nairobi	Gender Dimensions author
Mr. George Kichamu National Council for Population and Development	Disability author
Mr. Samuel Ogola National Council for Population and Development	Urbanization author
Mr. Peter Nyakwara National Council for Population and Development	Labour Dynamics author
Mr. Peter Ochieng' Kenya National Bureau of Statistics	Systems Maintenance
Mr. Rogers Mumo Munywoki Kenya National Bureau of Statistics	Formatting
Mr. Silas Mulwa Kenya National Bureau of Statistics	Formatting
Mrs. Milka Mwangangi Kenya National Bureau of Statistics	Formatting
Mr. George M. Kamula Kenya National Bureau of Statistics	Kenya Population Atlas author
Mrs. Hellen M. Wanyoike Kenya National Bureau of Statistics	Kenya Population Atlas author
Mr. Shem Onsare Kenya National Bureau of Statistics	Kenya Population Atlas author
Ms. Annette Adhiambo Aduda University of Nairobi	Intern/ Fertility and Nuptiality
Ms. Zena Lyaga University of Nairobi	Intern/ Education and Mortality
Ms. Susan Njoki Maina	Intern/ Population Projections
Ms. Margaret M. Mwaila	Intern/ Labour Dynamics
Ms. Truphosa Otwala	Intern/ Disability and Gender
Ms. Katunge Kiilu Kenya National Bureau of Statistics	Editor
